
1 Tempest Framework: Coding Conventions

- Variable names should following Hungarian notation conventions.
- Indentation shall be strictly performed with tabs.
- All `if` blocks must be accompanied by braces.
- One command per line except in rare circumstances (such as an assignment of a pair of variables). The author should be careful when including more than one command per line to ensure that readability of the code is not lost.
- Pointers and references shall be identified with whitespace as follows:

```
double * pTest = &test;  
double & dTest = test;
```
